Abstract. Marine Protected Areas (MPAs) are crucial for sustaining fish populations and marine biodiversity. This article explores the effectiveness of MPAs in promoting sustainable fisheries. By reviewing global case studies and recent research, the study assesses how MPAs contribute to the recovery of fish stocks and the protection of marine ecosystems. The findings advocate for the expansion and proper management of MPAs to support sustainable fisheries.

Keywords: Marine Protected Areas, Sustainable Fisheries, Marine Biodiversity, Fish Stock Recovery, Ecological Balance

Introduction

The establishment of Marine Protected Areas (MPAs) has emerged as a vital strategy for promoting sustainable fisheries and conserving marine biodiversity. This article delves into the role of MPAs in enhancing the resilience of fish populations and protecting marine ecosystems. Through an examination of global case studies and recent research findings, we evaluate the effectiveness of MPAs in facilitating the recovery of fish stocks and maintaining ecological balance. The study advocates for the expansion of MPAs and emphasizes the need for robust management practices to maximize their benefits. By highlighting successful examples from around the world, the article provides a compelling case for increasing commitment to MPAs as tools for sustainable fisheries.
